

Two-Tier Bristle Structure

Unique bristle structure combines brushing with flossing, removing plaque effectively even between your teeth and under the gum line. The 800 long, ultra-thin bristles imitate flossing action to clean plaque in hard-to-reach places, while the 800 short bristles take care of the big surfaces of your teeth.

Antibacterial Protection

The average toothbrush has over 10 million bacteria on it, but not Nano-b. By utilizing the natural antibacterial properties of gold, silver and bamboo charcoal, Nano-b eliminates up to 99% of the bacteria that gets on the toothbrush.

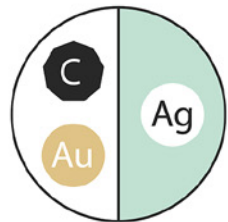

Travel-Friendly

Each Nano-b toothbrush comes in its own handy travel case, ideal for storage and travel. Now it's easy to take your toothbrush with you wherever life takes you.

Gold, Silver and Charcoal

There are genuine gold, silver and charcoal particles impregnated in the Nano-b bristles. Gold and silver release negatively charged ions that penetrate bacterial cells, suppressing the cell's respiration and metabolism. This kills bacteria and prevents further bacterial growth on your toothbrush. Charcoal is known for its natural whitening and toxins absorbing qualities, which helps your teeth stay cleaner and whiter.
